KNOLL .It works

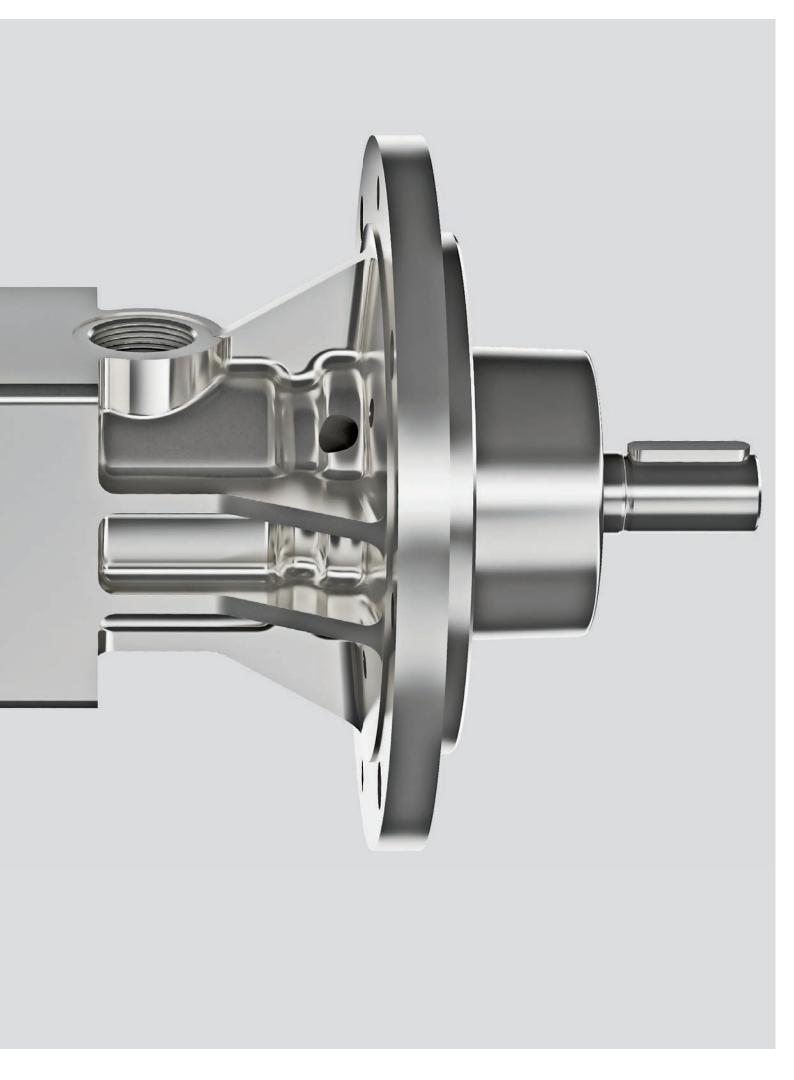

KNOLL is the largest employer in the Upper Swabian city Bad Saulgau with approximately 1,000 employees. Walter Knoll laid the foundation for the company in 1970. The family business supplies manufacturers and users of machine tools with conveyor and filter systems worldwide. All sectors that use machine tools for turning, milling, drilling or grinding apply KNOLL products, especially machine construction, electrotechnology, vehicle assembly, the aerospace industry and the energy sector. Since 1974, the company has grown continuously on its own premises. Its affiliation with and sense of responsibility toward the local region are part of its corporate philosophy. Whether planes, turbine buckets, car rims, knives or cell phones, the list of end products that KNOLL contributes to is highly varied.

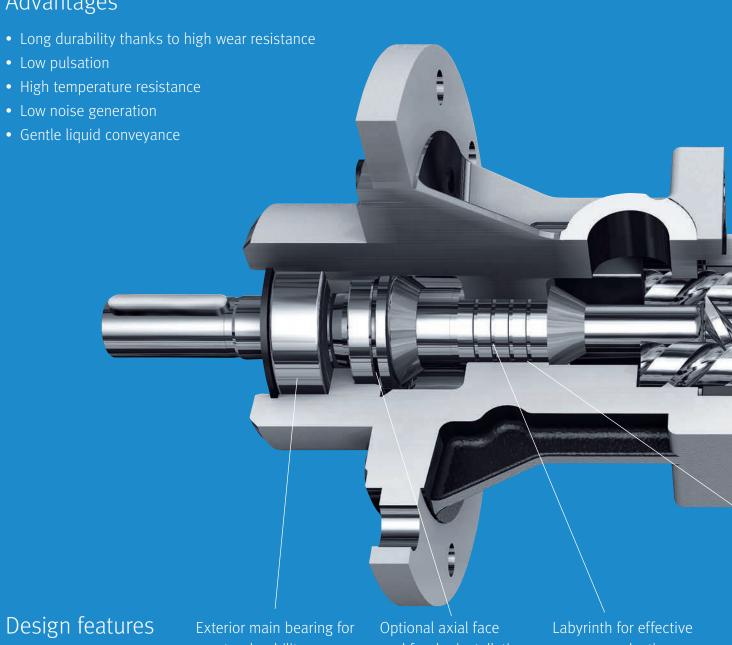

KNOLL Maschinenbau ranks among the leading suppliers of systems for conveying and filtering chips and cooling lubricants in the metal machining industry. The screw pump KTS has been a KNOLL success story for over 27 years. It conveys cooling lubricants (oils, emulsions, aqueous solutions) for high-pressure applications on machine tools. A typical example is cooling, lubrication and chip transportation for tools with an internal cooling lubricant supply during drilling and milling. The KTS offers innovative technology, durability and wear resistance. Through cutting-edge production technologies, continuous development and a highly efficient logistics and service network we have established ourselves in this segment.

Advantages

greater durability

seal for dry installation

pressure reduction and high efficiency

Layout

Screw pumps KTS by KNOLL are self-priming displacement pumps suitable for lubricating and little abrasive media. The pump consists of three primary components:

- 1. Suction housing, 2. Spindle housing with a drive spindle and two concurrently rotating running spindles,
- 3. Pressure port housing with throttling point, sealed shaft feedthrough and external main bearing. The spindle housing consists of two steel-embedded ceramic shells.

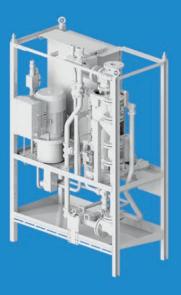

Optional ceramic piston bushing at the throttle gap to minimize wear Precision
manufactured screw
spindles from longlasting specially treated
tool steel

Precision manufactured spindle housing made of ceramic, thereby nearly wear-free

Wear resistant axial thrust balance

Type code	KTS 25-50-T-A-G-KB-B-H
Configuration	
Type / size	
Spindle pitch	
Model T	
Axial thrust balance	
Mechanical seal G/G4 G = inlet pressure ≤ 8 bar G4 = inlet pressure 8 – 20 bar	
Ceramic piston bushing	
Coating	
High pressure > 150 bar	

Coating

Wear-resistand coating of the drive spindle and screw spindles.

Versions

All pumps come in a submersible version for vertical installation (usually in containers) and in a foot version for horizontal dry installation.

KTS pumps can optionally be equipped with PQ-Tronic speed control.

Specifications

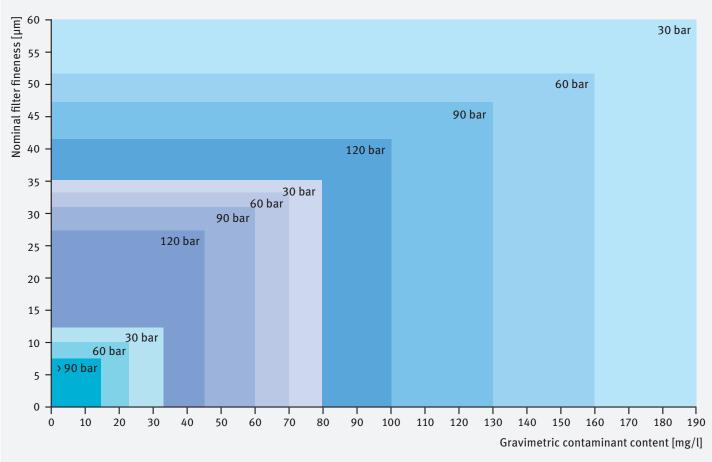

Delivery rate: 1 – 900 l/min Pressure increase: 1 - 200 bar Inlet pressure: max. 20 bar max. 130 °C Temperature: Kinematic viscosity: $1 - 2,500 \text{ mm}^2/\text{s}$ 3 – 5 vol. % Air content:

Inspection

Precision in accordance with inspection regulations Q > 100 l/min VDMA 24284, class II, group II

Q ≤ 100 l/min KNOLL instructions

Recommended filter quality

The information refers to the gravimetric contaminant content with a 5 μm cellulose membrane in 100 ml sample.

Very hard particles* 1,000 - 10,000 HV

Such as corundum, ceramic, SIC, glass and carbide metals. Corundum upon request

Hard particles 500 - 1,000 HV

Such as hardened steel, cast material with filler metal, aluminum with a high silicon content, abrasive: CBN/diamond

Soft particles < 500 HV

Such as unhardened steel, grey cast iron, non-ferrous metals

The KTS 60-130 and KTS 60-145 must be operated at an inlet pressure of at least 1.5 bar With an RPM of 3,500. Only the characteristic values of version T are shown, different values for other variants are possible.

1,750 rpm 60 Hz 1 mm²/s

Motor: 4-pole
Rotational speed: 1,750 rpm
Frequency: 60 Hz
Delivery rate: Q [l/min]
Power requirement: P [kW]

Viscosity: 1 mm²/s, such as emulsion

	Higher pressures upon request. Pressure [bar]: 10 20 30 40 50 60 70 80 90 100 110 120 130 140 150

Speed control with PQ-Tronic

Function

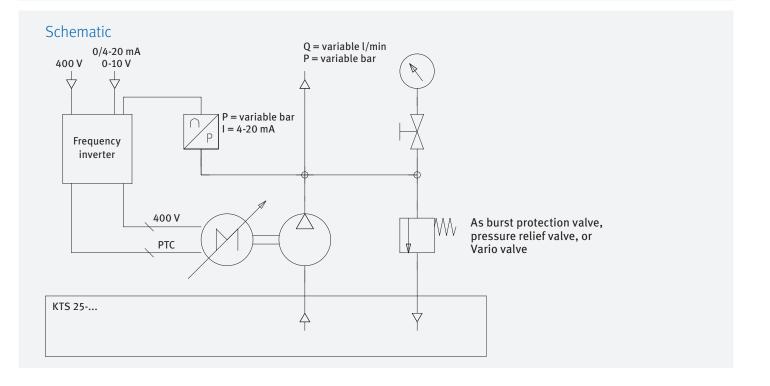

The KNOLL PQ-Tronic allows to specify desired pressures within a range of 0-150. With this system, pump performance is regulated automatically. By changing the drive motor from 10 Hz - 75 Hz, the rotational speed of the pump unit changes (500-4500 rpm) and therefore the performance characteristics change as well. A pressure sensor together with an electronic PI control ensures the specified pressure (target value) independent of the amount used.

Use

• Machine tools, machining centers and their tools with an internal coolant supply.

Advantages

- Any desired preset pressure with the M-function
- Energy savings of 50 70 % and hence quicker amortization
- Low pulsation conveyance
- Smooth starts and stops
- No power peaks during startup
- Speed adjustment to reduce noise
- · Less wear and maintenance
- Long service life with parameters optimized to the process
- Reduced heat input to the medium by adapting the performance, thus enabling a smaller cooler
- Minimum quantities with Vario valve at very low speed
- Vario valve as a safety valve with an offset for operating pressure

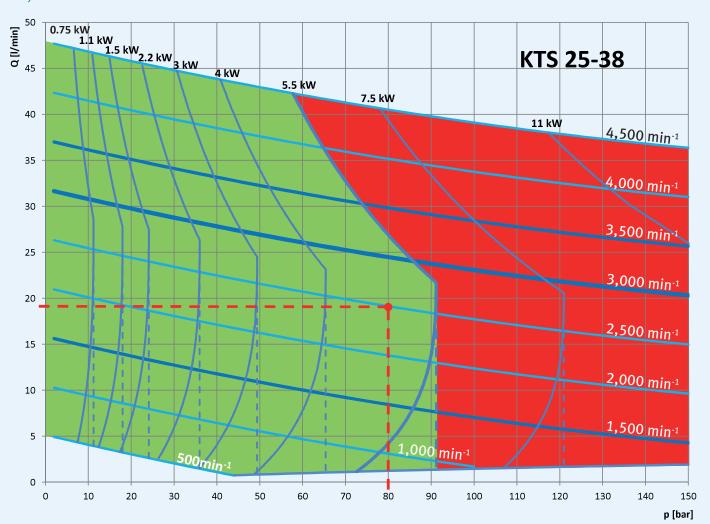

Example layout

Customer requirements

Medium: Emulsion
Viscosity: 1 mm²/s
Max. pressure increase: 80 bar
Delivery rate: 19 l/min

Speed control with PQ-Tronic

Results for three-phase motor

Power: 5.5 kW Rotational speed: 2,500 rpm

Number of pole pairs: 2

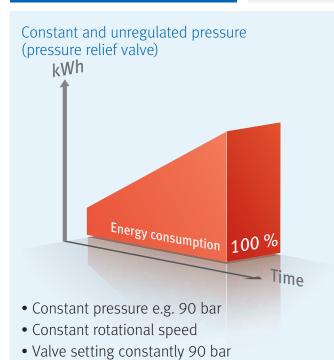

Option: PTC resistor

Benefits

Within the diagram, every operating point to the left of the motor characteristic (green area) is possible in terms of delivery rate and pressure. The motor performance characteristic results from the available torque at a specific pressure. For several operating points, the pump size is optimized with regard to the drive power.

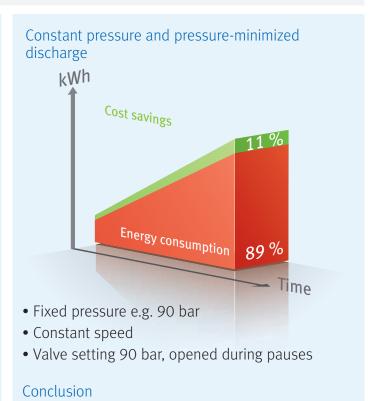

Comparison of pressure regulation

Energy savings for the processing of a gearbox housing calculated from the energy required to supply cooling lubricant.

Conclusion

Greatest energy consumption, lowest purchase

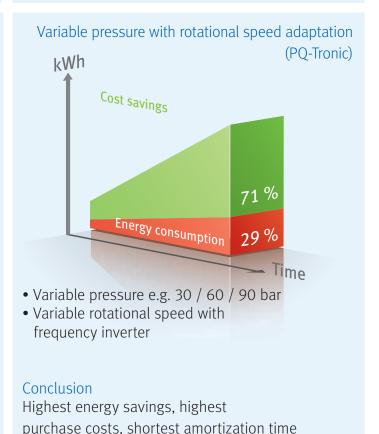

Low energy savings, low purchase costs

Variable pressure and pressure-minimized discharge

Conclusion

Average energy savings, average purchase costs, short amortization time

22

ENERGYNOW

We determine your possible energy savings on-site

So far, not many customers opted for our energy saving PQ-Tronic control technology because the determination of the possible savings was too complex.

NOW the measuring process is fast and simple

KNOLLE-PASS

We can determine your energy-saving potential on site with a brief measurement, followed by a computer calculation.

• Afterwards, you receive your energy protocol.

Additionaly, we provide you with an on-site cost/benefit appraisal, including your amortization analysis.

5 You then decide whether to go for a PQ-Tronic upgrade.

If you wish to obtain more detailed information, please contact us.

KNOLL E-PASS Measurement results

KNOLL E-PASS Measurement results

User report

Environmental protection is a priority for one of the world's most important system suppliers of transmission technology for passenger cars and light trucks. One of our goals is to make automobiles more environmentally friendly through the use of our products. Another goal is to minimize the ecological foot- print from production. All of the processes are continuously monitored and optimized in terms of costeffectiveness, energy and resource efficiency, and environmental compatibility.

The KNOLL E-PASS provided the customer with an analysis of the current situation and a calculation of possible savings including amortization. The evaluations are provided both graphically and tabularly. The customer added the KNOLL PQ-Tronic frequency control system to the original high-pressure pump with pressure relief valve.

KNOLL was responsible for connecting the frequency control system to an existing machine tool including the electrical and control system as well as ensuring the necessary safety appraisals.

Result: the reference plant confirmed the theoretically determined values. The amortization of the investment was less than two years.

Process monitoring with PQ-Tronic

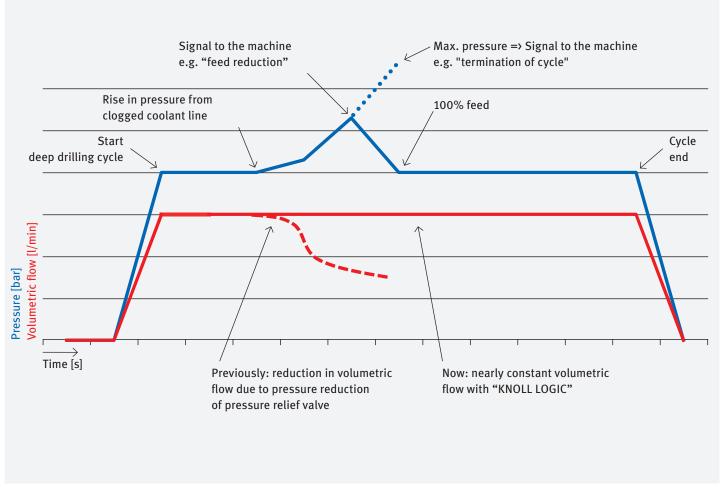

The KTS system for deep drilling using the PQ-Tronic

KNOLL uses the data from the frequency inverter to identify predictive signs of tool breakage. Relevant signals are forwarded to the CNC control so that the operator or machine can intervene in the process early enough.

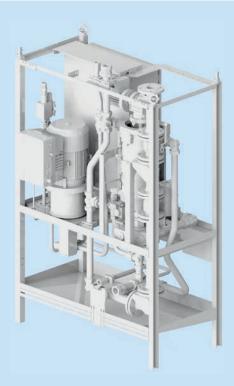

Customer benefits

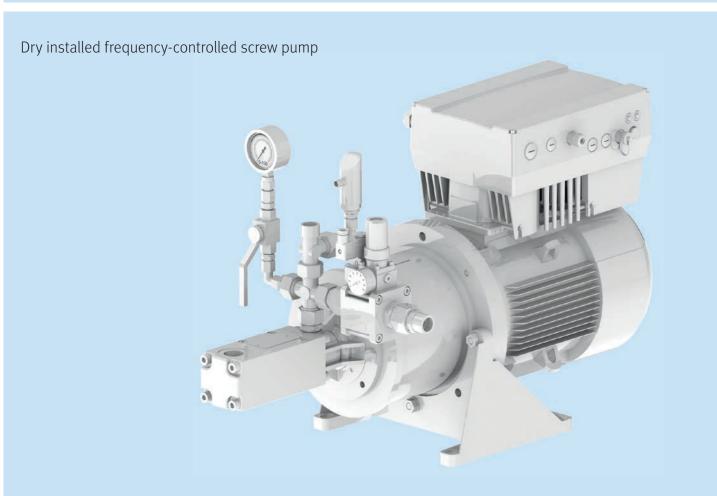

- Increased feed
- Greater process reliability
- Lower reject rate
- Reduced tool costs
- Early identification of tool wear
- Greater system availability
- Energy savings
- Increased productivity

Frequency inverter (FI) 0.75 – 22.0 kW

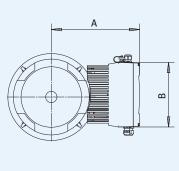

Advantages

- Compact dimensions by installing the inverter onto the box (piggyback).
- KNOLL control know-how included.

Technical data for standard motors IEC/EN 60034

Switch-on frequency: In order to minimize the stress to the pump and motor, the switch-on frequency should not exceed once per minute. For shorter switching operations, the pump should operate continuously and appropriate valves should be used to enable unpressurized discharge of the medium (see pages 36 - 37).

Pressure relief valves

Screw pumps are displacement pumps. Because of their design, pressure must be limited in order to maintain a reasonable motor current. In addition to burst protection, pressure relief valves that the preset pressure is maintained. Using dampened valves in screw pumps prevents pressure surges. In case of overpressure, unnecessary material is discharged through the valve.

Selection criteria

The selection of valves depends on the factors pressure, delivery rate, viscosity, adjustability.

Advantages

- Robust, insensitive to dirt
- The control part is separated from the cooling lubricant
- Easy change of pressure
- No pressure surges in the piping
- Constant pressure within large area
- Pressure-reducing circulation possible

Non-controlled pressure relief valve DBD (adjustable with tool)

Function

The response pressure of the valve is adjusted via an adjusting screw. When the set pressure is reached, the valve cone opens and the operating medium flows off the pressure connection via the tank connection. The valve should preferably be mounted vertically, with the adjusting screw down. The maximum flow is achieved without significant pressure increase.

Туре	Pressure [bar]	Delivery rate Q_{max} [l/min]	Connection thread
DBD040	10 - 30	60	G 3/4"
DBD085	20 - 60	60	G 3/4"
DBD130	50 - 100	60	G 3/4"
DBD150	90 - 150	105	G 3/4"

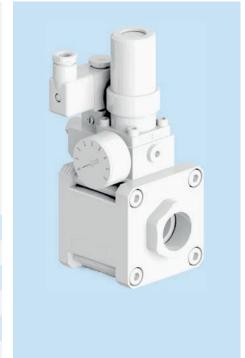

Pressure relief valves

Pneumatically controlled HPB pressure relief valve (manually adjustable)

Function

The operating pressure of the valve can be adjusted using a hand-wheel. The pressure-reducing circuit can be controlled electrically. The valve remains open without flow or pressure.

Туре	Pressure [bar]	Delivery rate Q _{max} [l/min]	Connection thread
3-HPB-H-12/160	5 - 160	100	G 1"
3-HPB-H-15	5 - 120	100	G 1"
3-HPB-S-15	5 - 64	100	G 1"
3-HPB-H-32	5 - 120	240	G 1 1/2"
3-HPB-S-32	5 - 64	400	G 1 1/2"
3-HPB-S-50	5 - 64	800	G 1 1/2"

Pneumatically controlled SPB pressure relief valve (electronically controlled)

Function

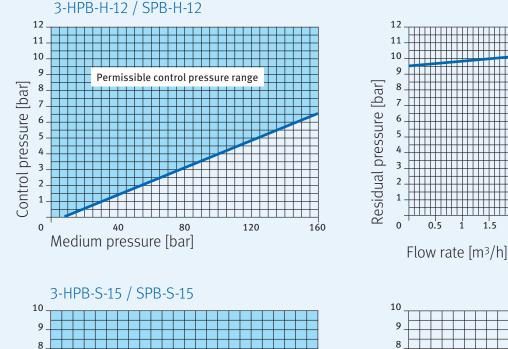

The variable valve allows you to specify desired pressures within a range of 5-160 bar. The machine control converts digital signals into analogue values (0 -10 V) to regulate the pressure. The pneumatic control pressure changes in proportion to the analogue value and regulates the medium pressure. The valve remains open without flow or pressure.

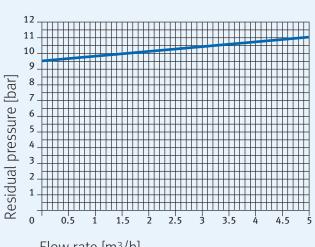

Type	Pressure [bar]	Delivery rate Q _{max} [l/min]	Connection thread
SPB-H-12/160	5 - 160	100	G 1"
SPB-H-15	5 - 120	100	G 1"
SPB-S-15	5 - 64	100	G 1"
SPB-H-32	5 - 120	240	G 1 1/2"
SPB-S-32	5 - 64	400	G 1 1/2"
SPB-S-50	5 - 64	800	G 1 1/2"

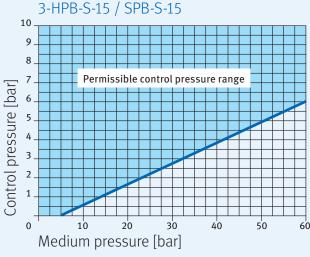

The air connection has to be maintained on a constant value with the help of a pressure regulator. For minimum control pressure, see pages 38-39. Valves for a higher delivery rate and pressure are available upon request.

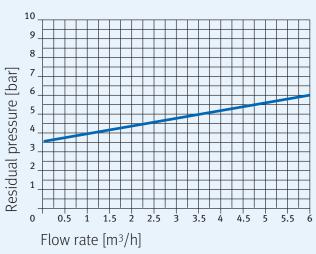

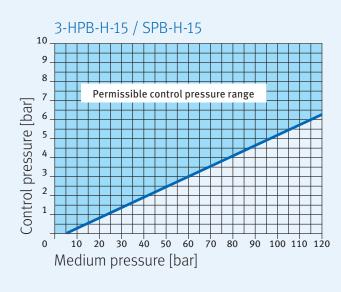

Characteristic curves for pneumatically controlled pressure relief valves

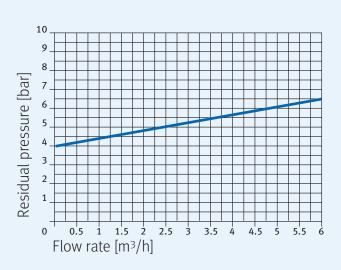

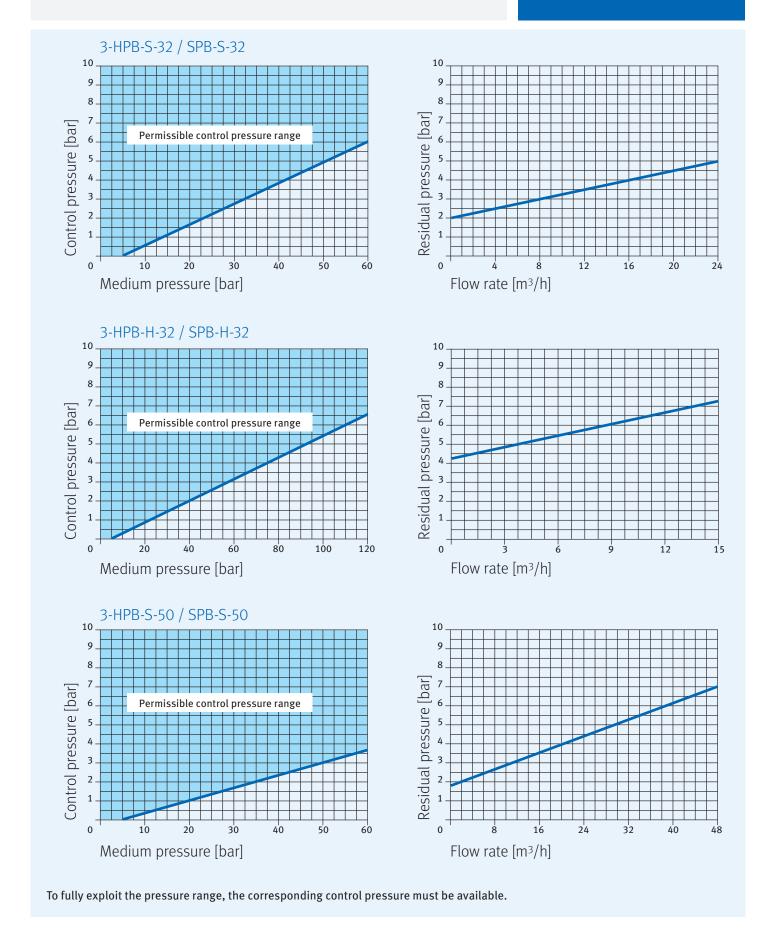

To fully exploit the pressure range, the corresponding control pressure must be available.
